

Project 3

By: Mhd Shadi Hasan

For this project, you're going to work with the Census Income dataset. You can learn about the dataset and install it from this link: <https://archive.ics.uci.edu/dataset/2/adult>

The dataset stores demographic information about 49k people. Your objective is to predict the income level (" $\leq 50K$ " or " $> 50K$ ") based on given features, indicating whether a person earns less or more than \$50,000.

Test at least three different models for the task (including a deep learning model), stating your preference, justifying your choice objectively.
